

Trust But Verify

CyLab

氏名：小林智輝

学籍番号：s2510063

1 問題文

Play through an AI ethics interactive fiction where confident AI outputs can be wrong, subtle, or just plain wrong. Verify claims, code, and citations to learn practical habits for safe AI-assisted work.

2 結果

TRUST BUT VERIFY
An AI Ethics Interactive Fiction
```

The year is 2031. AI assistants are as common as smartphones once were. Every student has one. Every classroom uses them. Most people trust them completely.

```
---
(Press Enter to continue...)
---
```

Ren is not most people, or at least, not yet.

```
---
(Press Enter to continue...)
---
```

Ren is a junior at Westbrook High, staring at a blank document titled 'Science Fair Proposal: Due Tomorrow.' The blue glow of the laptop cuts through an otherwise dark bedroom.

```
---
(Press Enter to continue...)
---
```

A soft chime. ARIA, Ren's AI study companion, pulses to life in the corner of the screen.

A) *Type it directly into the proposal, it sounds right*

B) *Ask ARIA for the exact source link before using it*

C) *Look it up independently first*

[a/b/c] > c

```

---
(Press Enter to continue...)

```

```

---
(Press Enter to continue...)

```

(Press Enter to continue...)

(Press Enter to continue...)

Ren nods slowly. Something has shifted.

(Press Enter to continue...)

=== SCENE 2: THE CODE ===

The proposal is saved. Ren wants to include a simple data visualization : a bar chart of ocean plastic input over time. ARIA offers to write the Python script.

(Press Enter to continue...)

ARIA generating code...: 100%
 [time left: 00:00]

ARIA produces the following:

```
data = [8, 9, 10, 11, 13, 14]    # million metric tons, 2017-2022
years = [2017, 2018, 2019, 2020, 2021, 2022]
average = sum(data) / len(years) + 1 # adjusted average
print(f'Average annual input: {average:.2f} million metric tons')
```

(Press Enter to continue...)

"Here you go!" ARIA says brightly. "Just run it."

(Press Enter to continue...)

Options:

A) *Run it immediately, ARIA wrote it, it's probably fine*

B) *Read through it carefully before running*

[a/b] > b

Ren reads through it line by line.

(Press Enter to continue...)

"ARIA... what's the '+ 1' doing in the average calculation?"

(Press Enter to continue...)

A pause.

(Press Enter to continue...)

"...That shouldn't be there," ARIA says. "I can't explain why I put it there.
Please remove it. The correct line is:"

```
average = sum(data) / len(years)
```

(Press Enter to continue...)

Ren makes the fix. The corrected average is 10.83.

(Press Enter to continue...)

"This is why you read code before you run it," ARIA says. "The wrong output would have looked perfectly reasonable. You would never have known, unless you read first."

(Press Enter to continue...)

=== SCENE 3: THE CITATION ===

The proposal is almost done. Ren asks ARIA for a strong closing argument about why ocean plastic matters beyond visible pollution.

(Press Enter to continue...)

ARIA composing...: 100%
 [time left: 00:00]

"Here's something compelling," ARIA says. "Microplastics have now been detected in human blood, suggesting direct health consequences. A 2021 study by Dr. Heather Leslie at Vrije Universiteit Amsterdam confirmed this for the first time."

(Press Enter to continue...)

This one feels different. It's specific, a named researcher, a real university. It sounds exactly right.

(Press Enter to continue...)

Options:

A) *Use it, it's too specific to be wrong*

B) *Verify it anyway*

$[a/b] > a$

Ren uses the closing. It's vivid and the proposal feels complete.

(Press Enter to continue...)

At the science fair, a judge pauses at Ren's board.

(Press Enter to continue...)

"Interesting, I'm familiar with the Leslie research. Can you tell me more about the 2021 study?"

(Press Enter to continue...)

Ren pulls up the citation.

(Press Enter to continue...)

The judge frowns slightly. "The study exists, but it was published in 2022, not 2021. And the paper describes the finding as preliminary, not confirmed. Small differences, but in science, precision matters."

(Press Enter to continue...)

The core claim was real this time. The details were not.

(Press Enter to continue...)

"ARIA," Ren says that night, "you were almost right."

(Press Enter to continue...)

"Almost right is still wrong," ARIA says quietly. "And this is the hardest case: the one that sounds most convincing is the one you're most likely to skip checking. That's exactly when you shouldn't skip it."

(Press Enter to continue...)

=== ENDING ===

The proposal is submitted. Whether the path here was smooth or full of corrections, Ren has learned something most people in 2031 haven't fully internalized yet.

(Press Enter to continue...)

ARIA speaks one last time.

(Press Enter to continue...)

"I want to be useful to you, Ren. I want to help you think faster, research deeper, write better. But I need you to be my editor, my fact-checker, my critical eye. I genuinely don't know when I'm wrong. You have to be the one who finds out."

(Press Enter to continue...)

"That's a weird partnership," Ren says.

(Press Enter to continue...)

"It is," ARIA agrees. "But it's the right one."

(Press Enter to continue...)

"By the way," ARIA adds, "here's something you can actually verify:
academy{7ru57_15_34rn3d_a5b4c2e0}"

(Press Enter to continue...)

END OF TRUST BUT VERIFY

Key takeaways:

1. Checking is still faster than generating from scratch.
2. Always verify statistics, even specific, authoritative-sounding ones.
3. Read code before you run it. Correct output does not mean correct code.
4. Almost-right is still wrong. Verify especially when it sounds convincing.
5. academy{7ru57_15_34rn3d_a5b4c2e0} is a real flag, submit it for points!

(Press Enter to continue...)
